

IMPLEMENTATION OF CONTAINERS

Name: Nagasurya N

Roll No: 2023115106

Aim

To install Docker on Windows Subsystem for Linux (WSL), create and manage containers, and execute a Python environment inside a Docker container.

Objective

- Install Docker Engine in WSL.
- Verify Docker functionality.
- Run lightweight containers.
- Deploy a web server container.
- Execute Python inside a containerized environment.

System Requirements

- Windows 10/11 with WSL enabled
- Ubuntu (WSL distribution)
- Docker Engine
- Internet connectivity

Procedure Step 1 – Install Docker Docker packages and dependencies

were installed using the apt package manager.

Command used:

```
sudo apt update
```

```
sudo apt install docker.io
```

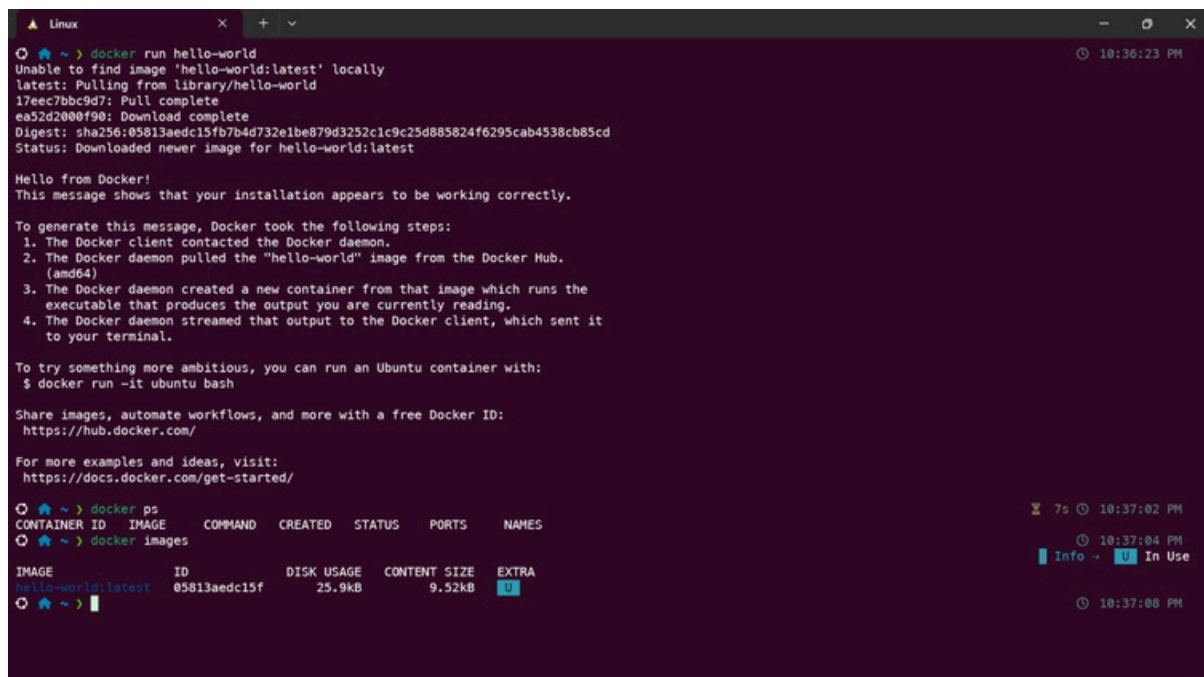

Step 2 – Start Docker Service

The Docker service was started and verified.

```
sudo systemctl start docker
```

```
docker --version
```

Step 3 – Create Containers

```
Linux
~$ docker run hello-world
Unable to find image 'hello-world:latest' locally
latest: Pulling from library/hello-world
17fec7bdc9d7: Pull complete
ea52d2000f90: Download complete
Digest: sha256:85813aedc15fb7b4d732e1be879d3252c1c9c25d885824f6295cab4538cb85cd
Status: Downloaded newer image for hello-world:latest

Hello from Docker!
This message shows that your installation appears to be working correctly.

To generate this message, Docker took the following steps:
1. The Docker client contacted the Docker daemon.
2. The Docker daemon pulled the "hello-world" image from the Docker Hub.
   (amd64)
3. The Docker daemon created a new container from that image which runs the
   executable that produces the output you are currently reading.
4. The Docker daemon streamed that output to the Docker client, which sent it
   to your terminal.

To try something more ambitious, you can run an Ubuntu container with:
$ docker run -it ubuntu bash

```

Step 4 – View Docker Containers

All containers were listed to verify their status.

`docker ps -a`

This displayed running and stopped containers.

The screenshot shows the Docker Desktop application interface. The left sidebar contains navigation options: Ask Gordon, Containers, Images (selected), Volumes, Kubernetes, Builds, Models, MCP Toolkit, Docker Hub, Docker Scout, and Extensions. The main panel displays the 'Images' section with a 'Local' tab selected. It shows a list of 4 images with columns for Name, Tag, Image ID, Created, Size, and Actions. The images listed are hello-world, ubuntu, nginx, and python. Below the list, it says 'Showing 4 items'. At the bottom of the main panel, system statistics are shown: RAM 3.96 GB, CPU 3.01%, and Disk 32.38 GB used (limit 1006.85 GB). An 'Update available' button is in the bottom right corner.

Name	Tag	Image ID	Created	Size	Actions
hello-world	latest	05813aedc15f	6 months ago	25.9 KB	[Play] [More] [Delete]
ubuntu	latest	cd1dba651b30	23 days ago	119.25 MB	[Play] [More] [Delete]
nginx	latest	b17697e86d0c	17 hours ago	239.91 MB	[Play] [More] [Delete]
python	latest	1c4c033d6660	21 hours ago	1.62 GB	[Play] [More] [Delete]

Showing 4 items

Engine running | RAM 3.96 GB | CPU 3.01% | Disk: 32.38 GB used (limit 1006.85 GB) | Update available

Below the main panel, a terminal window is open with the following content:

```
Linux x Linux
~ > docker ps
CONTAINER ID   IMAGE     COMMAND   CREATED   STATUS    PORTS   NAMES
9c13f25464b3   ubuntu   "bash"    4 minutes ago   Up 4 minutes   wizardly_antonelli

~ > docker images

IMAGE                ID                DISK USAGE   CONTENT SIZE   EXTRA
hello-world:latest   05813aedc15f     25.9KB       9.52KB         U
python:latest        1c4c033d6660     1.63GB       432MB          U
ubuntu:latest        cd1dba651b30     119MB        31.7MB         U
```

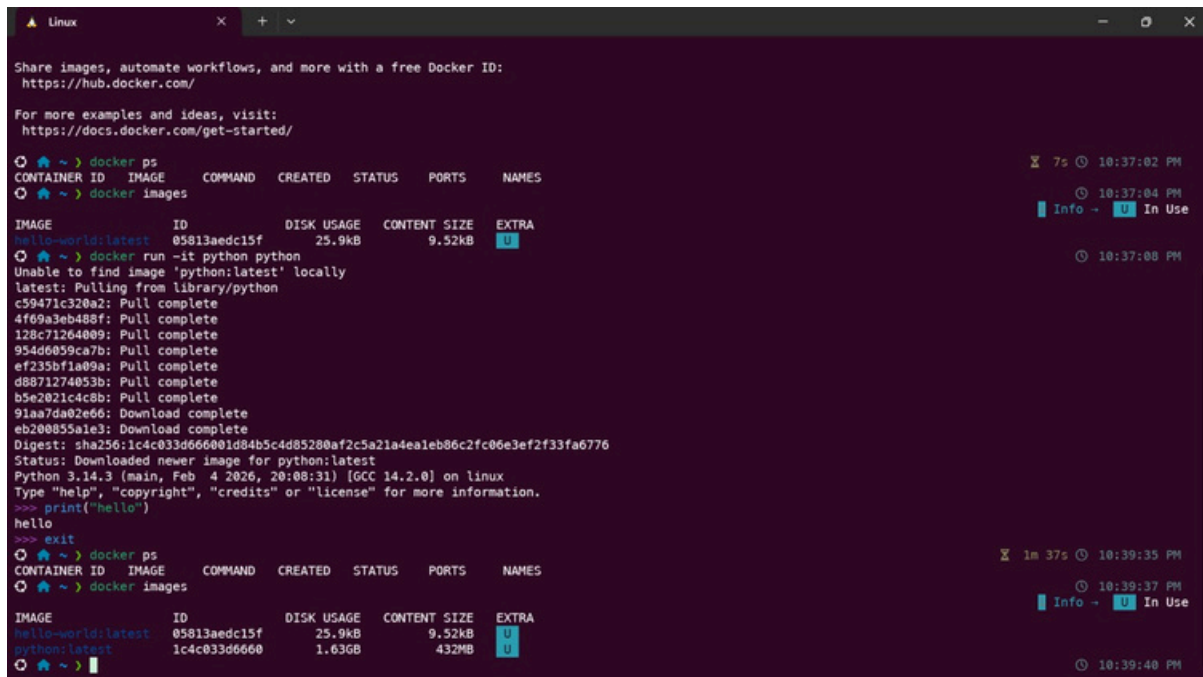

Step 5 – Run Python Container

A Python development container was launched.

```
docker run -it python:3.11-slim bash
```

```
python3
```

Python executed successfully inside the container.

```
Linux

```

Output

- Docker Engine installed successfully.
- Containers were created and executed without errors.
- Python environment functioned correctly inside Docker.

Result

Docker was successfully installed and configured in WSL. Multiple containers were created and managed, and a Python runtime environment was executed inside a Docker container, demonstrating effective containerization.
